

Advanced HEight ADjustment

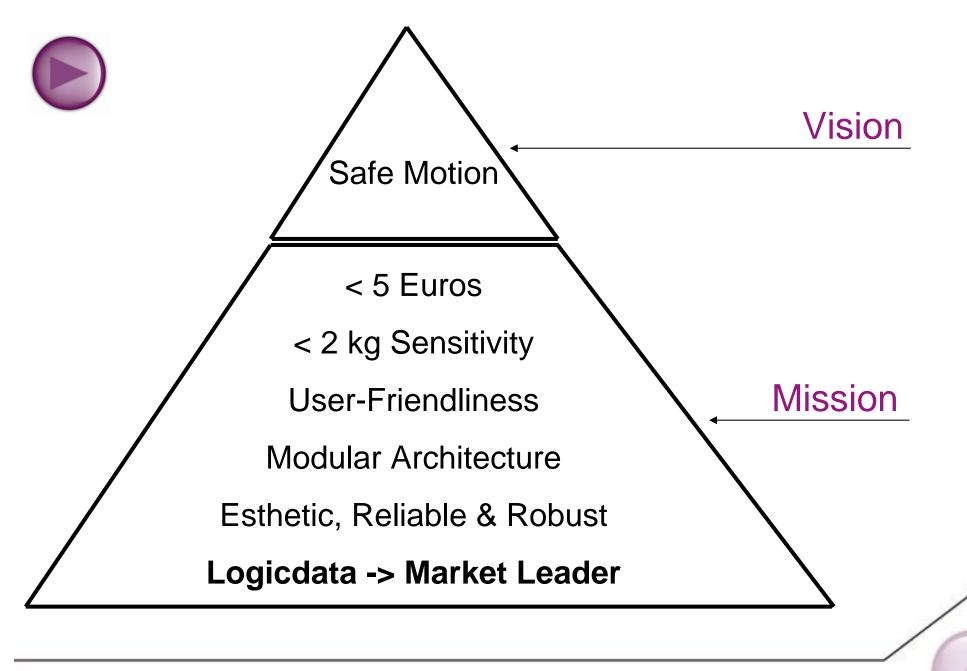

FINAL PRESENTATION

TASK DESCRIPTION

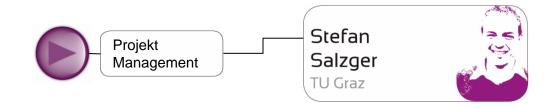

One of the problems with height adjustable office desks is that it continues moving even when there is a crash with an obstacle.

The project goal was to find a solution to detect and stop the table immediately as it hits an object.

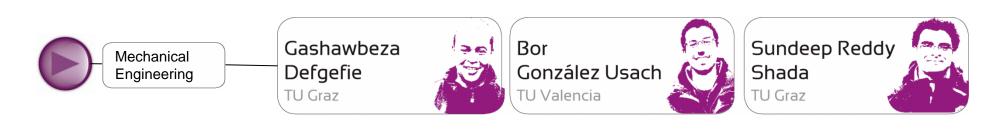

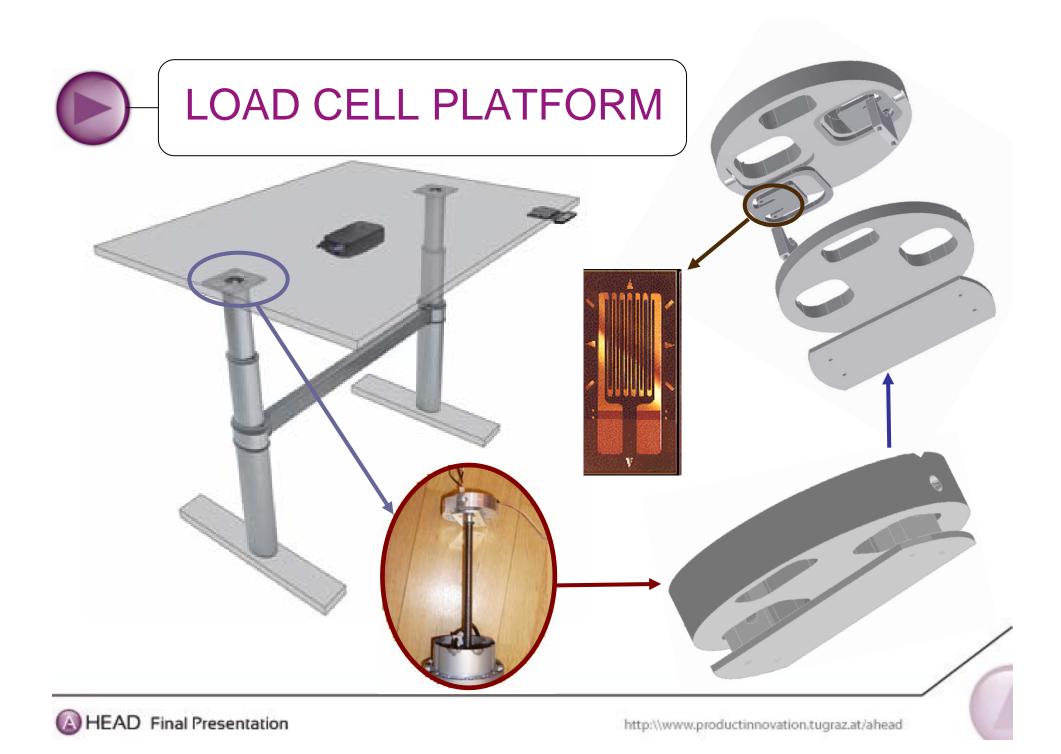

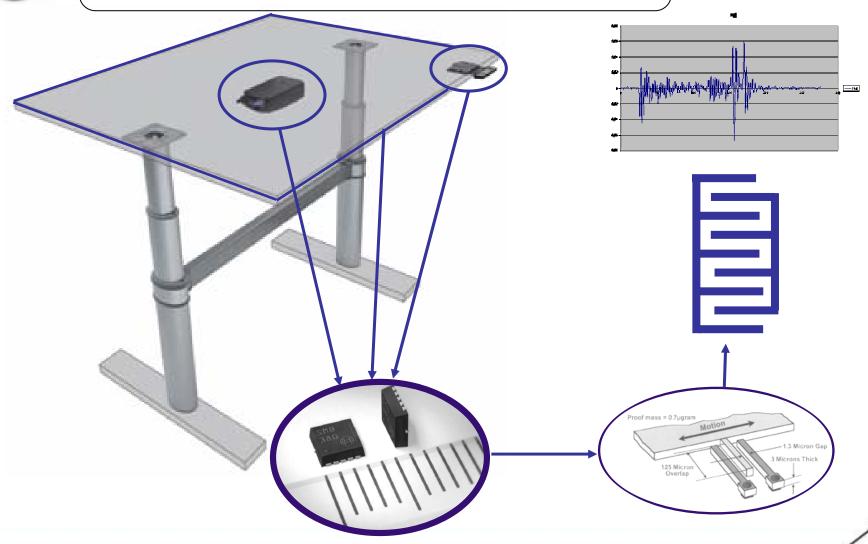

TWO WORKING PROTOTYPES

MEMS – ACCELERATION SENSOR

Possible effects on sales

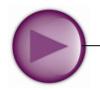

- Costs < 10 € a table
- Logicdata contribution margin ratio 35 %
- Average price for a control unit is around 40 €
 - With these figures LD should get about a 5,4 €
 contribution margin per sold safety system → an average price for the safety system would be 15,4 €
 - This means an addition of 15,4 € in revenues per a sold safety system

Possible effects on sales

- Logicdata sells about 300.000 control units a year
- If the safety system is sold to 1/2 of the customers → an addition of 2.310.000 € in revenues is achieved or 810.000 € in contribution margin
- In 2007 Logicdata's revenue was about 10,7 Mio
 € → the addition would be 21,6 % with 150.000 sold safety systems
